TWY resistance protein N - tobacco (Nicotiana glutinosa)
C; Species: Nicotiana glutinosa
C; Date: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_change 05-Nov-1999
C; Accession: A54810
R; Whitham, S.; Dinesh-Kumar, S.P.; Choi, D.; Hehl, R.; Corr, C.; Baker, B.
Cell 78, 1101-1115, 1994
A; fitte: The product of the tobacco mosaic virus resistance gene N: similarity to tol
A; Reference number: A54810; WUD: 95007759
A; Accession: A54810
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-1144 < WHI>
A; Cross-references: GB: U15605; NID: 9558886; PIDN: AAAS0763.1; PID: 9558887

                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (EIM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
ETM; mismatch; genotyping;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 936 BP; 5 A; 142 C; 7 G; 6 T; 776 other;

The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                                                                                                                                                                                                                                                                                                                                                ;
Additionally, May be used to produce the colon cancer associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and ABB77789 represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprises a 3'-end sequence, where the oligonuclectide which comprises a 1'-end sequence, where the combination of the 5'-end sequence, sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the etection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. AAH13628 and AAH13633 to AAH13612 represent human cDNA sequences; and AAH13629 to AAH13632. The present human mino acid sequences; and AAH13632. The present human mino acid sequences: and AAH13632 to AAH13632.
          (b) a combination
      comprises at least 15 nucleotides; or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the present invention.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comparises: (a) an oligo-dT primer and an oligonoucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence of oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide comprises a 1-and sequence complementary to a polynucleotide comprises a 1-and sequence which comprises and sequence oligonucleotide comprises a 1-and sequence which comprises and sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers also useful for the connection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and ANISAS and ANISAS and ANISAS 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAB95893 represent human amino acid sequences, and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Primer*** for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        acaattgtcaatgtctatggtgttgtgaagttctttaagcccccatatctaagcaaagga 120

Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides: or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                          1819

ö
sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3 -end sequence; where the oligonucleotide comprises at 3-end sequence the comprises at least 15 nucleotides and the combination of the 5-end sequence/3-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13613 to AAH18631 represent human cDNA sequences, AAB92446 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                   240

                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sciencesis, and Shy Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assaays for receptor activity, arthritis and inflammation, leukaemias and

The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set (ull-length cDNAs defined in the specification. Where a primer set to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotides sequences defined in the specification, where the oligonucleotide comprising a sequence complementary to the following the following sequence complementary to the comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence is nucleotides and the complementary to a polynucleotide comprises a 1-east 15 nucleotides and the complementary to a polynucleotide sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the complementary without any specialised methods. full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

Claim 8; SEQ ID 11187; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligord T primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the ombination of the 5'-end sequence(3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers also votaining of the full-length cDNAs. The primers are also waseful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the AMH13613 to AMH13613 to AMH13613 to AMH13613 to AMH13614 to AMH13618 and AMH13613 to AMH13614 thuman amino acid sequences; and AMH13629 to AMH13612 represent luvention.

The present sequence represents module 8 of the FK-520 polyketide synthase (PKS) gene cluster of strain MA6548. FK-506 is a potent final consuppressants, and acts through intial formation of an intermediate complex with protein immunophilins known as FK-506 binding proteins. The nucleic acids are used for producing polyketide compounds are used as immunosuppressants to prevent or treat transplant rejection, graft-verus-host disease or uveitis. They can also be used for treating e.g. alopecia universalis, autitiple sclerosis, primary biliary cirrhosis, or scleroderma. They also have neurotrophic activity and can be used to promote neurite outgrowth in NGF-treated PC12 cells and in sensory neuronal cultures, and in intact animals, they promote regrowth of damaged facial and sclatic nerves, and repair lesioned serotonin and dopamine neurons in the brain. They can also be used for treating e.g. Parkinson's disease, Alzheimer's disease, stroke, traumatic spinal cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and cord and brain injury, or peripheral neuropathies. They can also be used in agricultural and contains a

                                                                                                                                                                                                                                                                                                                                                                                                               The CDNA sequence encoding the carbamoyl-phosphate-transferase II (CPSII) of Plasmodium falciparum was determined. The CDNA encodes a protein that includes 2 insert sequences not found in other CPSII proteins. The first separates the putative structural subdomain and the glutaminase subdomain of the glutamine-amidotransferase subunit CPSII while the second separates 2 ATP binding subdomains of the CPSII subunit, CPSa and CPSb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a tomato verticillium polypeptide. The polypeptide is encoded by Vel.1 and Vel.2 resistance genes. The polypeptide confers resistance to Verticillium species in a plant. Verticillium are fundi, which cause verticillium wilt in plants. This is a common vascular diseases that causes sever yield and quantity losses in many crops. The polypeptide is useful for producing a transgenic plants that are resistant to Verticillium species.

                                                                                                                                                                                 irus resistance gene N sequences from tobacco - useful for ing transgenic Solanaceous plants resistant to Tobacco Mosaic
                                                                                                                                                                                                                                                                                                             octiana glutinosa N gene protein (AAR88123) mediates ince to tobacco mosaic virus (TMV). The gene (AAT09341) for the protein was obtd. from a N. glutinosa leaf genomic / by screening with a cDNA clone. DNA sequences encoding the n can be used to generate transgenic plants, esp. Solanaceae, int to TMV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LRSIQNLNSLVDKTSWIPSSVAEALGIVPLQYVFVMTFTLDDGTGVLEAY-LMDSDKF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                    Peptide #8301 encoded by probe for measuring placental gene expression.

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
comptises: (a) an oligo-dT primer and an oligounclectide complementary
to the complementary strand of a polynuclectide comprises one of
the 5602 nucleotide sequences defined in the specification, where the
cligonuclectide comprises at least 15 nucleotides; or (b) a combination
of an oligonuclectide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence complementary to a
polynucleotide which comprises a 3'-end sequence of the complementary to a
polynucleotide which comprises a 1'-end sequence, where the
oligonucleotide comprises a 1'-end sequence is selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers also useful for the
cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
AAH136131 to AAH13612 represent human cDNA sequences; and AAH13629 to AAH13612

represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                   <del>ن</del> ;

FUNCTION: RECEPTOR INVOLVED IN THE DEVELOPMENT OF THE FUNCTION: RECEPTOR INVOLVED IN THE DEVELOPMENT OF THE CARDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE FORMATION OF CERTAIN NEURONAL CURCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVINESTY. PRESUMED TO BE INVOLVED IN THE NEURONAL RECOGNITIC DETWEEN THE OPTIC NERVE FIBERS AND THE VISUAL CENTERS.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: RETINAL GANGLION CELLS AND VISUAL CENTER

-I- FUNCTION: MAY HAVE A ROLE IN THE RECOVERY OR ADAPTATION RESPONSE OF PHOTORECEPTORS. MAY HAVE A ROLE IN DEVELOPMENT. MAXIMAL ACTIVITY IS OBSERVED AT PH 8.0.
-I- CATALYTIC ACTIVITY: A PHOSPHOPROTEIN + H(2)O = A PROTEIN + ORTHOPHOSPHATE (THIS ENZYME IS SERINE/THREONINE SPECIFIC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Huang X., Honkanen R.E.;

ALTERNATIVE PRODUCTS: 5 ISOFORMS; 1 (SHOWN HERE), 1A, 1B, 2

ARE PRODUCED BY ALTERNATIVE SPLICING. ISOFORM 3 MAY HAVE NO FUNCTIONAL SIGNIFICANCE.

TISSUE SPECIFICITY: DETECTED IN RETINA AND RETINAL DERIVED RETINOBLASTOMA CELLS. ALSO FOUND IN FETAL BRAIN.

SIMILARITY: BELONGS TO THE PPP FAMILY OF PHOSPHATASES.

SIMILARITY: CONTAINS 1 IQ DOMAIN.

SIMILARITY: CONTAINS 2 EF-HAND CALCIUM-BINDING DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       COFACTOR: MAGNESIUM.

CC CHARGE AND IS INVOLVED IN THE CHARGE-SELECTIVE ULTRAFILTRATION
CC PROPERTIES. IT INTERACTS WITH OTHER BASEMENT MEMBRANE COMPONENTS
CC SUGH AS LAWININ AND COLLAGEN TYPE IV AND SERVES AS AN ATTACHMENT
CC SUBSTRATE FOR CELLS.
CC I. SUBCHIT: PURIFIED PERLECAN HAS A STRONG TENDENCY TO AGGREGATE IN
CC SUBCELULAR LOCATION: EXTRACELLULAR.
CC I. SUBCELLULAR LOCATION: EXTRACELLULAR.
CC I. TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES.
CC I. PIN: CONTAINS THE HEPRAN SULFATE CHAINS AS WELL AS N-LINKED
CC I. SIMILARITY: CONTAINS 4 LDL-RECEPTOR CLASS A DOMAINS.
CC I. SIMILARITY: CONTAINS 3 LAMININ DOMAINS IV.
CS SIMILARITY: CONTAINS 3 LAMININ DOMAINS.
CC I. SIMILARITY: CONTAINS 3 LAMININ DOMAINS.
